

Title: Neuro-degenerative diseases by UV radiation from nanoparticles

Prevenslik, T,

QED Radiations, Discovery Bay, Hong Kong, CHINA

Keywords: Autism, Alzheimer's, vaccines, food, nanoparticles, DNA damage, UV radiation

I. Abstract

Autism from NP's is a risk [1,2] to the health of US citizens, not only to the newborn in vaccines, but also in baby. NPs stands for nanoparticles. Similarly, NPs in GM food are risk to the elderly for Alzheimer's. GM stands for genetically modified. The CDC is in charge of recommending the vaccination schedule for Autism in US children, which has grown by more than 6,000% as shown in the thumbnail. CDC stands for Center of Disease Control. The CDC monitors vaccine safety and tracks the number of children with Autism in the US. In 2016 after the US election, a group of senior CDC scientists filed [3] an ethics complaint alleging the CDC was influenced by corporate and political interests. Collusion is suggested by the departure of the head of CDC—Julie Gerberding—to be head of the vaccine division of Merck. The scientists argued the CDC misrepresented the rise in Autism rates since the late 1980 's - a view consistent with the just elected President Trump who is quoted as saying:

"When I was growing up, Autism wasn't really a factor," he [Trump] said. "And now all of a sudden, it's an epidemic. Everybody has their theory, and my theory is the shots. They're getting these massive injections at one time. I think it's the vaccinations."

President Trump is right about Autism as UV radiation from NPs in vaccinations damages brain cells, but he should go further and include NPs in baby food. For the elderly, protection from Alzheimer's requires banning NPs in GM food. Although the US Congress has not acted in banning NPs, Trump should encourage future legislation to be enacted that bans NPs not only from vaccines, but also from baby and GM foods.

IV. Biography:

Thomas Prevenslik developed the theory of simple QED based on the Planck law of quantum mechanics. Differing from the complex QED by Feynman and others, simple QED assumes any heat absorbed in NPs having high surface-to-volume ratios place NP atoms under high EM confinement that by the Planck law precludes the NP from having the heat capacity to conserve heat by an increase in temperature. Instead, simple QED conserves heat by creating UV radiation from NPs in the vaccine that damages the DNA of neurons to cause Autism consistent with the opinion of President Trump. Protecting the US citizen against neuro-degenerative disease requires US legislation to prohibit the use of NPs in vaccines and GM foods.
